Global Facility for Disaster Reduction and Recovery

**OPEN  
DRI**

Open Data for  
Resilience Initiative

Underlying nature of risk is  
changing. Data describe a  
very dynamic reality.

Photo: American Red Cross

Understanding dynamic risks requires better data

Without better data  
about the invisible,  
communities cannot make  
different choices about risk

But data is often inaccessible

# Open Data for Resilience Initiative

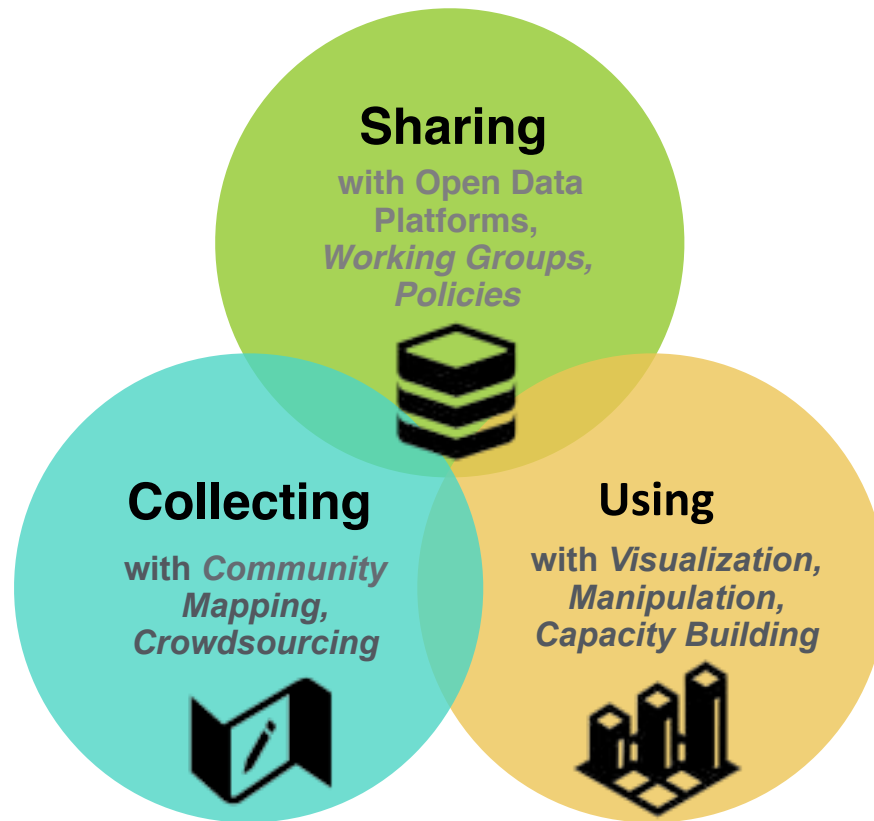

---

The **Open Data for Resilience Initiative (OpenDRI)** looks to facilitate the sharing of climate and disaster risk data to enable more effective decision-making by providing the rationale, technical assistance, and tools for data sharing.

# Open Data for Resilience Initiative Focus Areas

---

# Traditional Approach to Data Collection

---

# Advantages to a Collaborative Approach

---

Started in Haiti and Indonesia using the OpenStreetMap platform

**Resources focused  
towards building  
capacity**

**Transparent &  
Reusable**

**Scalable and  
Maintainable**

**Foster more  
usage of the data**

**Collaborative**

**Builds Govt capacity to  
understand risk**

**Building local ownership and  
trust in the data**

**Raises community  
awareness of risk**

**OpenStreetMap**  
is the answer

## Building Characteristics Survey

Div. Division Name: Manenunai North

GN name: Palanessadu GN code: 1730

Map Id:

### 1. General information:

#### 1.1 References

Map Building ID:

House Address Number (if visible):

#### 1.2 Building usage

Residential	
Commercial	
Industrial	
Utility	

School	
Hospital	
Religious	
Government	

#### 1.3 Number of Stories

1		4	
2		5	
3		6 or more	

Other specify: .....

1.4 Type of usage (do not collect for regular houses): ....

1.5 Name of the building (do not collect for regular houses): .....

### 2. Building characteristics:

#### 2.1 Check only if applicable:

Roof without wall (hr): ☐

Under construction: ☐

Abandoned: ☐

#### 2.2 Principal material of construction of the walls:

Plastered	
Exposed Brick	
Exposed Cement Block	

Tin Sheet	
Clay wall / Mud	
Cadjan / Palmyrah	

Other specify: ...

#### 2.3 Foundation height:

Normal (1 foot or less)	Knee high (1.5 feet)	Water high (3 feet)	Higher than 3 feet
----------------------------	-------------------------	------------------------	-----------------------

### 3. Principal material of construction of the roof:

Clay / Cement Tile	
Asbestos	
Concrete slab	

Permanent Zink Sheet	
Tin Sheet/Temporary Zink	
Cadjan/Palmyrah/Straw	

Other specify: ...

#### If applicable, number of faces for the main roof:

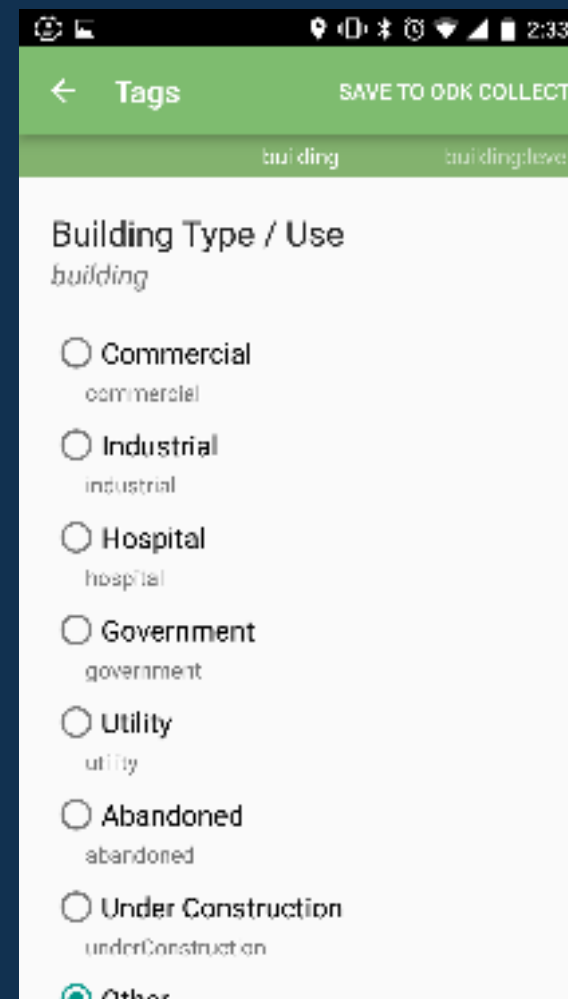

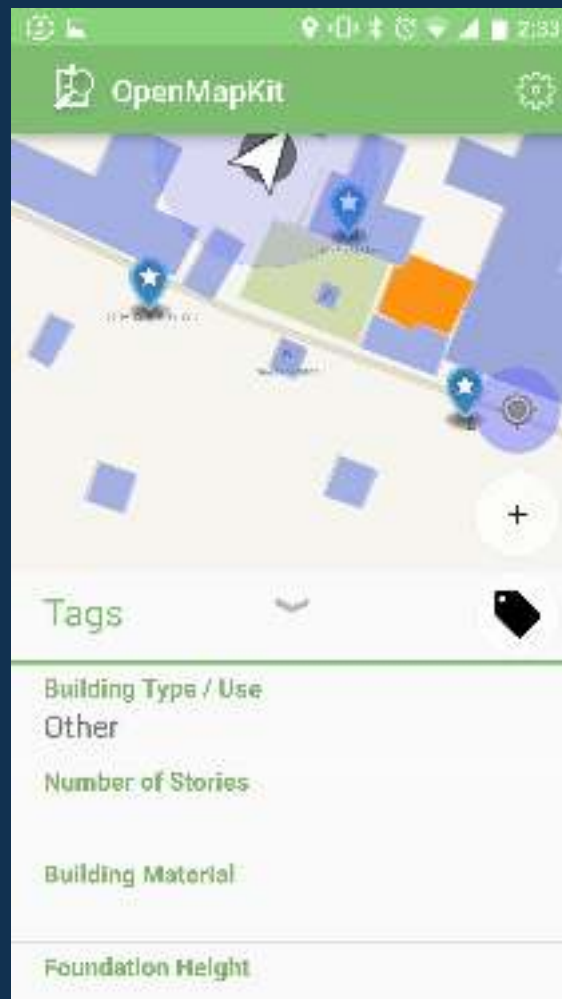

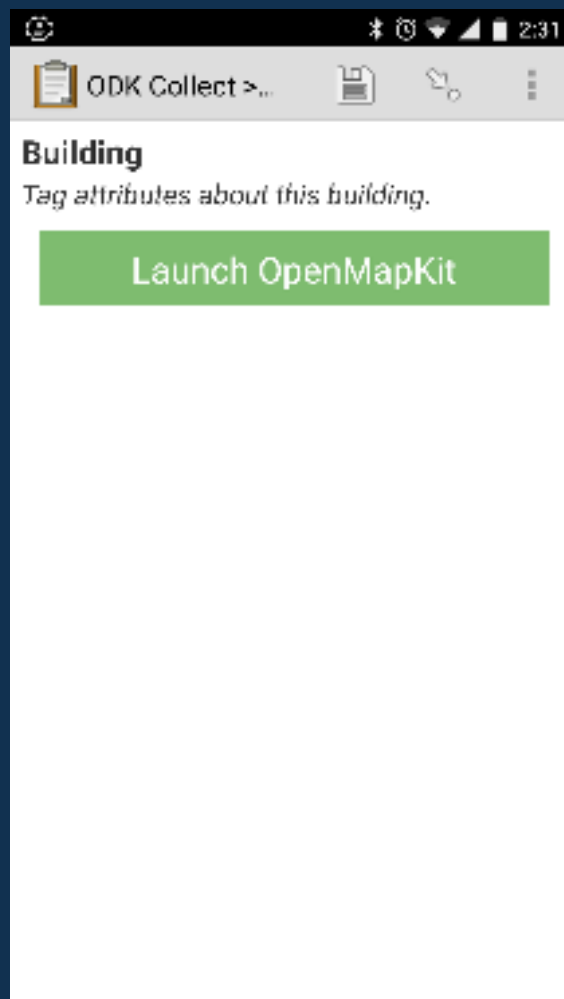

1 face (lean-to): ☐

2 faces (pitched): ☐

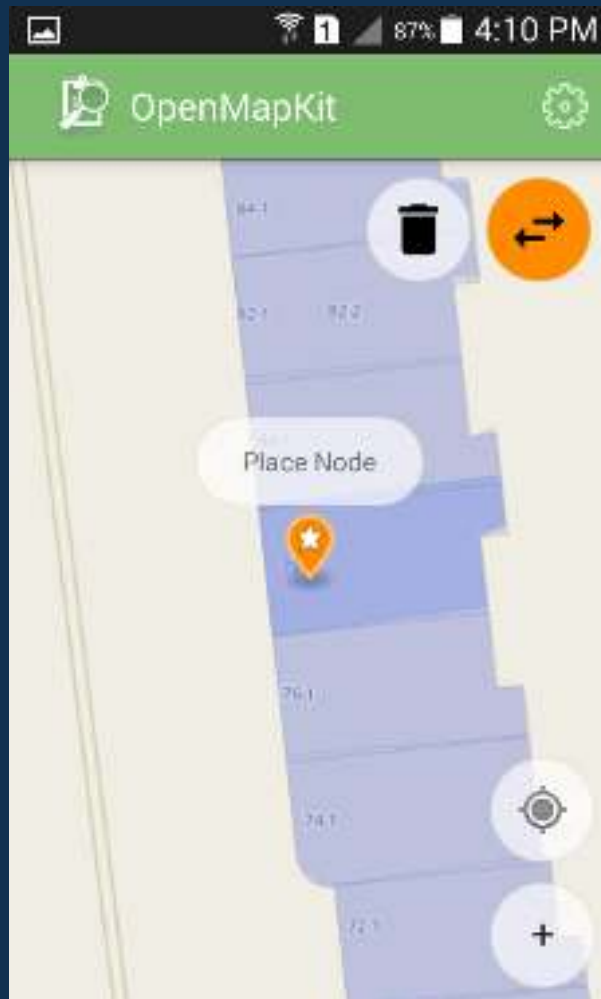

4 faces (hipped): ☐

# Building the team

A man in a pink shirt is standing in a classroom, pointing his right index finger towards a large projection screen. The screen displays a software interface with a map and various data points. In the foreground, the back of a person wearing a yellow shirt is visible, sitting at a desk with a computer monitor. The room has a whiteboard on the left and several computer monitors on desks. A projector is mounted on the ceiling.

# Fieldwork

Collecting data

A person is shown in profile, looking down at a smartphone held in their right hand. Their left hand is pointing at a map on a piece of paper that is resting on a clipboard. The map shows a street layout with various buildings and landmarks. The person is wearing a white shirt with a black collar. The background is a dense, green, leafy bush. The overall scene suggests a field research or data collection activity.

Using the data

## Ja – Ela Divisional Secretariat

**Building exposure**  
39,697 Buildings

Flood response

**Buildings with flooding**

Flood response

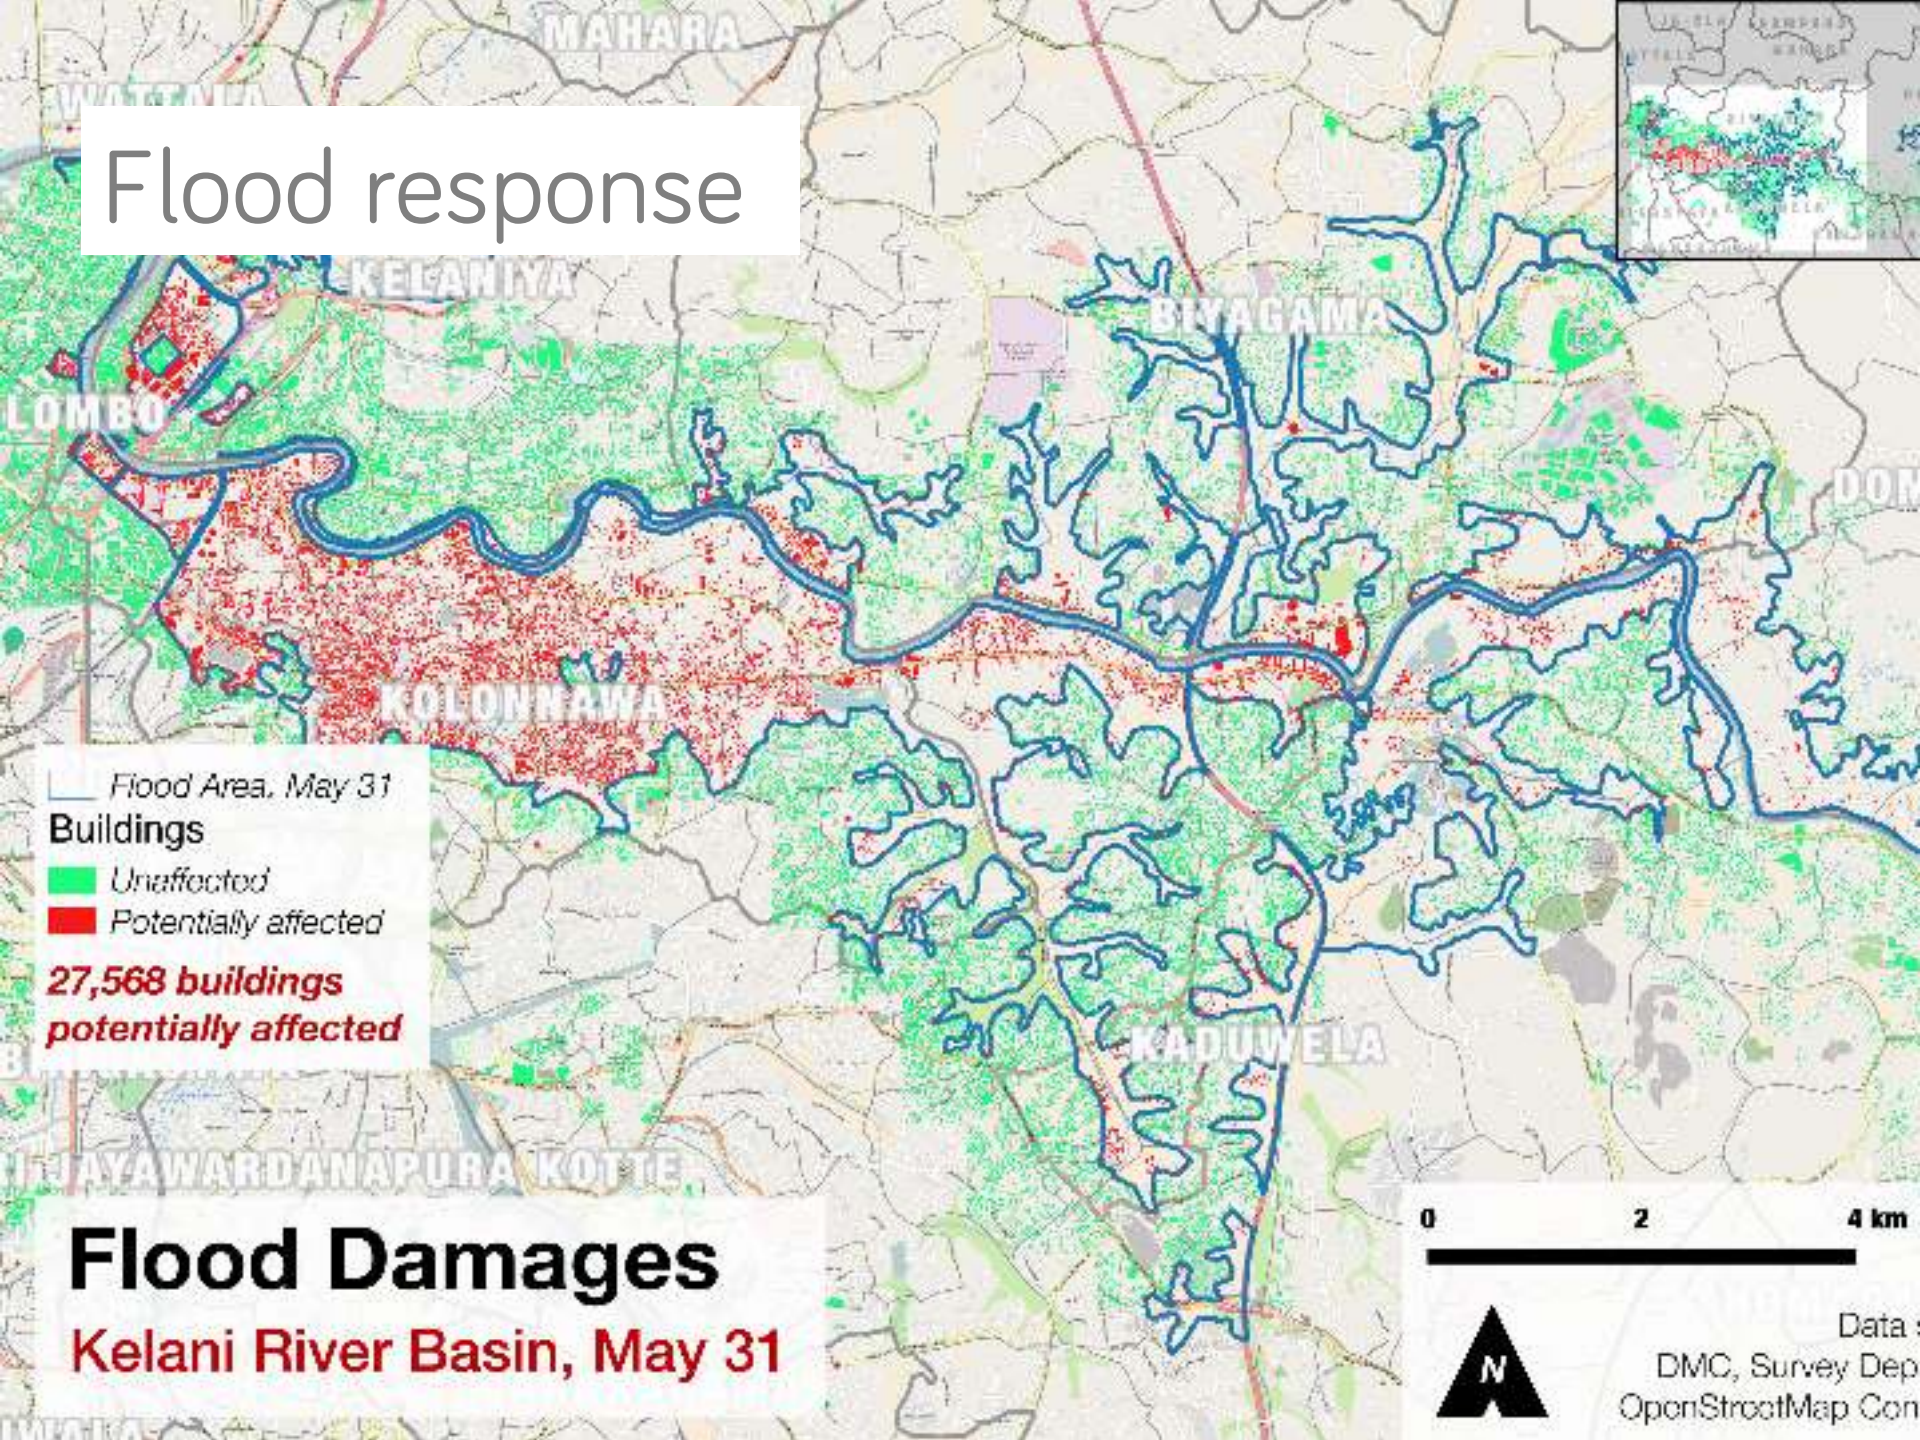

**Buildings affected by floods**  
11,647 Buildings

Flood response

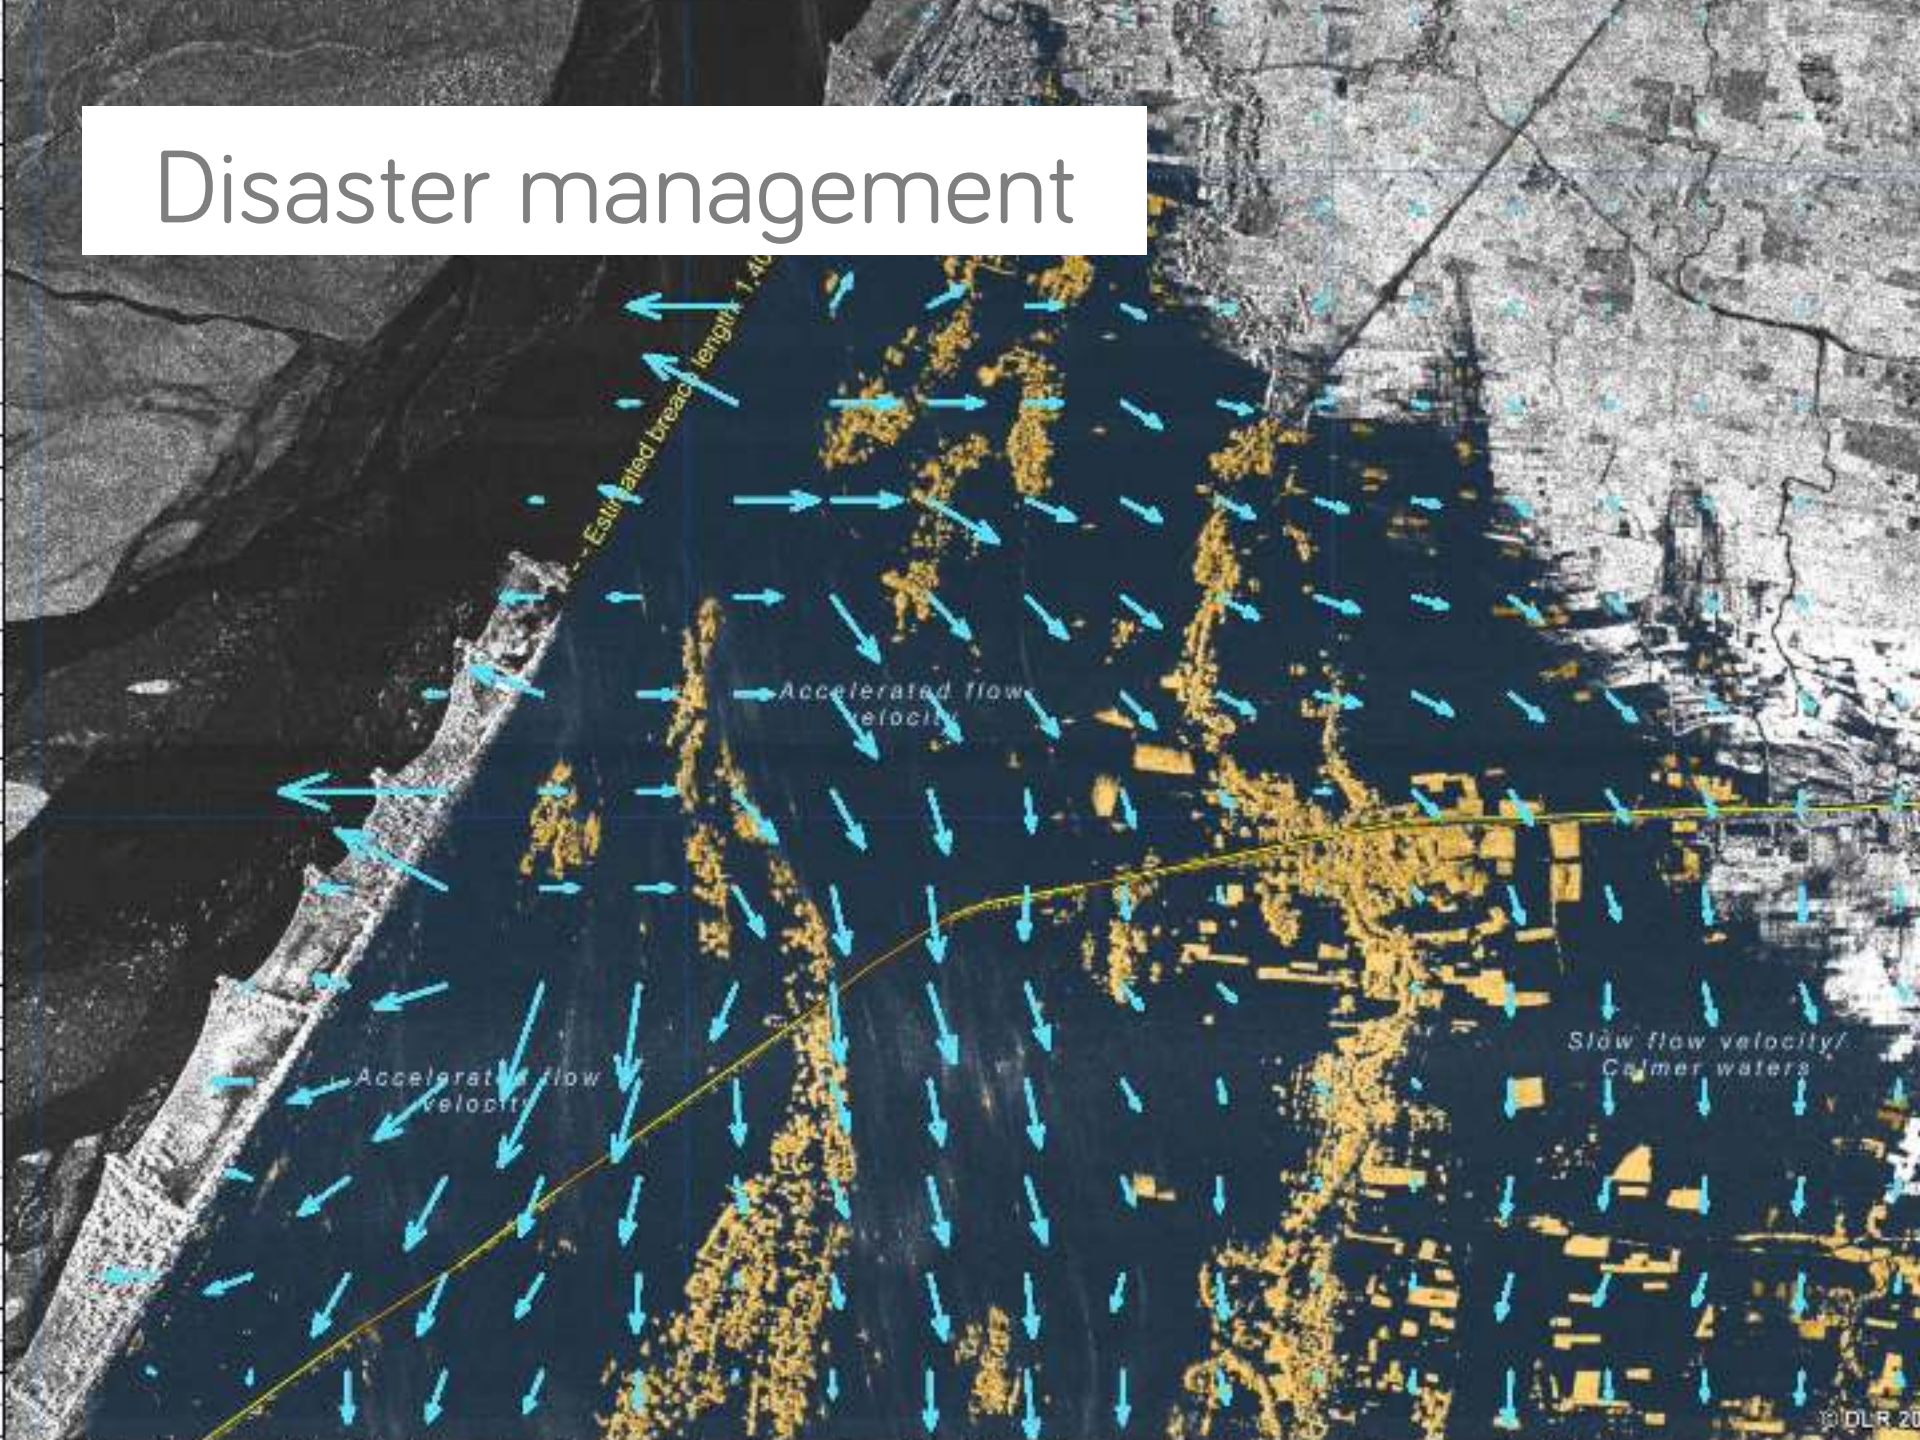

# Flood response

# Disaster management

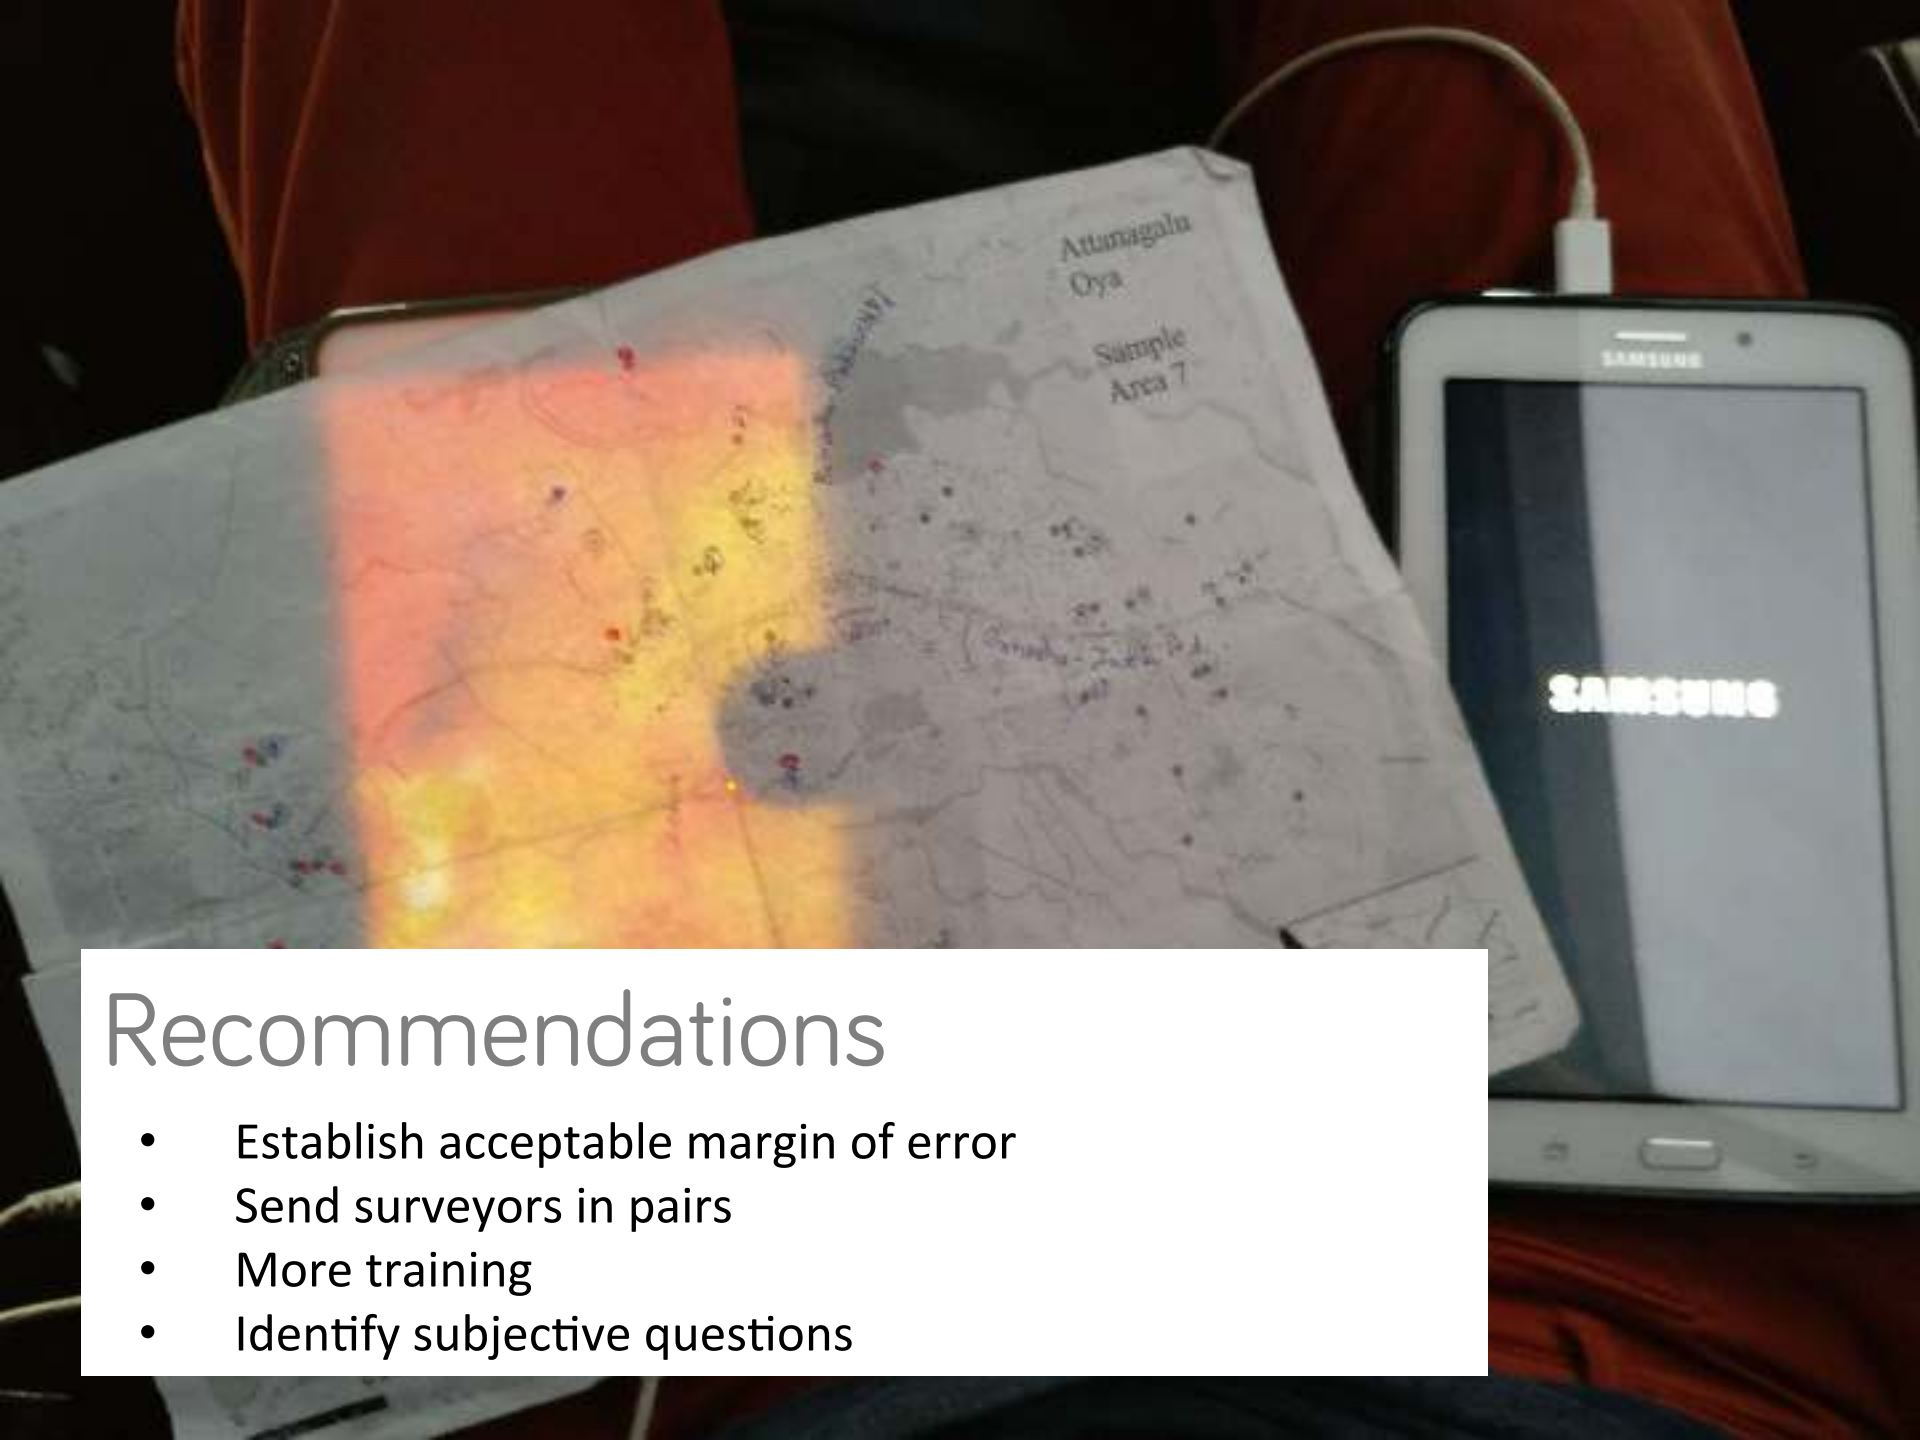

# Learning

# Assessment Findings

- Data quality could be improved
- Urban, rural areas make no difference in data quality
- Paper, digital tools make no difference in data quality

# Recommendations

- Establish acceptable margin of error
- Send surveyors in pairs
- More training
- Identify subjective questions

Looking forward

# Sharing existing data

---

- Some data often exist or is collected, but need to be collated and made more easily accessible
- Ensure that data produced funded by donors are made openly available

# TYPHOON YOLANDA GEONODE

Several organizations are building damage assessments after Super Typhoon Yolanda (Haiyan). This site serves as a repository of the data "behind" the damage assessments which are available on other web sites. The principles are clear: Data must be legally and technically open. Data must be clean, useful, and findable. Curators will do our best to ensure the resources adhere to these principles. Our mailing list is available here: [mailing list](#).

## Flood and Landslide Situation

On 15 May 2016 Sri Lanka was hit by a severe tropical storm that caused widespread flooding and landslides in 22 districts out of 25 districts in the country, destroying homes and submerging entire villages. At least 104 people are known to have died following this disaster; 99 people are still missing, the majority due to a landslide in Aranyake, Kegalle District, which devastated three villages.

### Earthquake

*Hazard level: High*

In the area you have selected [name of location], earthquake hazard is classified as **high** according to the information that is currently available. This means that there is more than a 20% chance of potentially damaging earthquakes shaking in your project area in the next 30 years. Based on this information, the impact of earthquakes must be considered in all phases of the project, in particular during design and construction. Project planning decisions, project design, and construction methods should take into account the level of earthquake hazard. Further detailed information should be obtained to adequately account for the level of hazard.

### Recommendations

- Consider the disturbance due to [phenomenon] on the availability and function of public services; transport, communications, water, sanitation and energy infrastructure; public health and on agricultural production.
- Consider the effect that collapse (or destruction) or serious damage to buildings and infrastructure associated with the planned project could have on the local population and environment.
- Consider purchasing insurance to cover potential losses to the project.
- Contact local or international staff that have experience of working in the project area to understand how they sought to reduce earthquake risk in past projects (see additional information).
- Contact the governmental organisations (e.g. ministry of environment and geological survey) responsible for management of earthquake risk in the project country to obtain more detailed information on the potential earthquake risks.
- Obtain and comply with the seismic regulations and building codes relevant to the project areas, especially with respect to planning and construction. This includes type

Earthquake hazard level
